Tides from Naurstad

(Quality not eveluated)

Tide tables are for long-term planning. We recommend water level forecast at the Se havnivå website for planning within the next five days.

Kartverket

Data last updated: 26. March 2026.

Downloaded: 21. October 2026.

Kartverket

Preface

The table gives times and heights of high and low waters. Time is current time in Norway. It is adjusted according to daylight saving time. Heights are given in cm above Chart Datum, which is the reference level for depths in navigational charts. The table is produced by the Norwegian Mapping Authority.

Data and quality

The Norwegian Mapping Authority has close to 30 permanent tide gauges along the Norwegian coast, and one at Spitsbergen, that registers the water level continuously. The water level measurements are used to calculate the tide tables.

The coast is divided into zones that have roughly the same tidal conditions. The tide in each zone is related to the nearest permanent tide gauge, using a time lag and a conversion factor for the height. Data from the zones are marked with quality classes. The closer to a permanent tide gauge the zone is, the more accurate the data are. The zones are improved continuously.

Meteorological conditions affect the water level

In addition to tides, the water level is affected by meteorological effects, especially variations in air pressure and wind. The meteorological contribution can cause water levels to deviate more than a meter higher or lower than what the tide table says. In some cases the water level may fall below Chart Datum due to the weather effect.

A water level forecast for the next five days is available at the Se havnivå website. The forecast is provided by the Norwegian Meteorological Institute, and it is the sum of the predicted weather effect and predicted tides. If you are interested in water level information for within the next five days, we recommend that you use the water level forecast, especially in the south of Norway where the difference in height between low- and high tide is small compared to the weather effect.

Se havnivå website

The Norwegian Mapping Authority has a website which provides information on observed water level in real time, water level forecast for the next five days, tides, important vertical datums, land uplift, historical data and future sea level projections for almost all locations along the Norwegian coast:

Heights are given in cm above Chart Datum Time is current time in Norway. It is adjusted according to daylight saving time. The transitions are marked with lines. Lunar phases: Full moon ○, new moon ●, first quarter ◐, and last quarter ◑.
Quality class 0. Data last updated: 26. March 2026. Downloaded: 21. October 2026.

Level diagram

SALTSTRAUMEN

Levels related to tides are from Naurstad, adjusted by a factor of 1.00.

Kartverket

Levels are in cm above Chart Datum which is reference level for depths in navigational charts and heights in tide tables. Data last updated: 26. March 2026. Downloaded: 21. October 2026.

High-end water level
High-end water level is the combination of the highest astronomical tide and a 1-in-1000 years surge.

High-/low water with return period
Statistical calculations of how frequent a high-/low water of a certain size occur. Example: an extreme high water with 50-year return heigth occur, on average, every 50 year.

Highest Astronomical Tide
The highest tidal level which can be predicted to occur under average meteorological conditions and under any combination of astronomical conditions.

Mean High Water Springs
The average height of the high waters of spring tides.

Mean High Water
The average height of all high waters over a 19-year period.

Mean High Water Neaps
The average height of the high waters of neap tides.

NN 2000
Norwegian vertical datum of 2000

Mean Sea Level (1996-2014)
Average height of the ocean"s surface in a periode of 19 years.

Mean Low Water Neaps
The average height of the low waters of neap tides.

Mean Low Water
The average height of all low waters over a 19-year period.

Mean Low Water Springs
The average height of the low waters of spring tides.

Chart Datum
Reference level for depths in navigational charts and heights in tide tables. In Norwegian waters Lowest Astronomical Tide (LAT) is used as Chart Datum north of Utsira (an island close to Stavanger). In the southern part (between Utsira and the Swedish border) the tidal range is small and Chart datum is 20 cm lower than LAT. In the inner Oslofjord Chart Datum is 30 cm lower than LAT.

Lowest Astronomical Tide
The lowest tide level which can be predicted to occur under average meteorological conditions and under any combination of astronomical conditions.
